

Adobe Acrobat 9 Pro (Macintosh and Windows) as well as *Adobe Acrobat 9 Pro Extended* (Windows only) provide preflight profiles for validating compliance with the the latest Ghent PDF Workgroup specifications. These profiles appear in the *Prepress* section of the *Preflight* window (as shown at left).

Note that in normal use, there should be no reason to need to repair or reinstall these profiles. However, should these profiles be unintentionally deleted or modified, there are two methods that may be applied to restore these predefined profiles to their initial values.

Method 1:

Invoke the **Repair Acrobat Installation** function from within Acrobat. This function should restore any missing or improperly modified Acrobat product components. This function can take a significant amount of time to run.

Method 2:

If the first method does not restore the profiles or as an alternative method for quickly restoring the GWG profiles:

(1) Within Acrobat, invoke *Preflight* and export any custom profiles you wish to preserve and then quit Acrobat.

(2M) *Macintosh Only* – Delete directory
~/Library/Acrobat User Data/Preflight Acrobat 9

(2W) *Windows* – For XP, delete directory
C:\Documents and Settings\<username>\Application Data\Adobe\Acrobat\Preflight Acrobat 9

For Vista, delete directory
C:\Users\<username>\AppData\Roaming\Adobe\Acrobat

(3) Restart Acrobat. When you invoke *Preflight*, all pre-defined profiles will be regenerated.

(4) Import any profiles you saved in step (1).
